Temperature sensor

The CTD48M is a high quality, high accuracy 4 channel probe for oceanographic and limnological measurement of conductivity, temperature, pressure and one optional parameter for depth up to 6000 m.

The probe is equipped with a precision microprocessor-controlled 4 channel 20 bit analog to digital converter.

Software:

The supplied Standard Data Acquisition Software package "SST-SDA" includes the handling of the logging process and the display of online or recorded data with a shared graphical user interface. The "SST-SDA" calculates the physical values from the raw values supplied by the probe and the associated calibration coefficients. Salinity, density, sound velocity and depth will be calculated by using the UNESCO Formula. The "SST-SDA" is a part of our shipment.

Memory

Data is available as RS-232 signal (multi-conductor sea-cable) to a PC.

More than 255 casts can be stored at profiling and continuous mode as long as the flash memory or the battery capacity is sufficient.

Up to 3 000 000 CTD data sets can be recorded, the actual number depends on the selected storage options and the number of sensors adapted to the probe.

CTD48M runs from an internal battery and records data at programmable time intervals or pressure stamps in a non-volatile FLASH memory with a capacity 128 Mbytes.

Recording modes

- Continuous mode: each data set is stored.
- Time mode: data sets are only stored at programmable intervals with a choice of several schemes.
- Increment mode: data sets are stored at programmable depth stamps.
- Online mode (RS-232).

The probe power supply is activated by touching a reed contact with a magnetic rod. LED displays power supply status and optical control of memory access.
